

SKYHEDGE

Weather risk, with a receipt.

NOAA evidence → clear protection terms → wallet
approval → finalized Solana proof

Devnet pilot · SKYT has no real-world value

Weather loss is personal. The evidence should be inspectable.

01 Name a place

A farm, an event, or another rainfall-exposed plan.

02 Understand the trigger

Exact station, dates, units, fixed payout, and maximum test cost.

03 Approve deliberately

No invisible transaction: the wallet signs only after review.

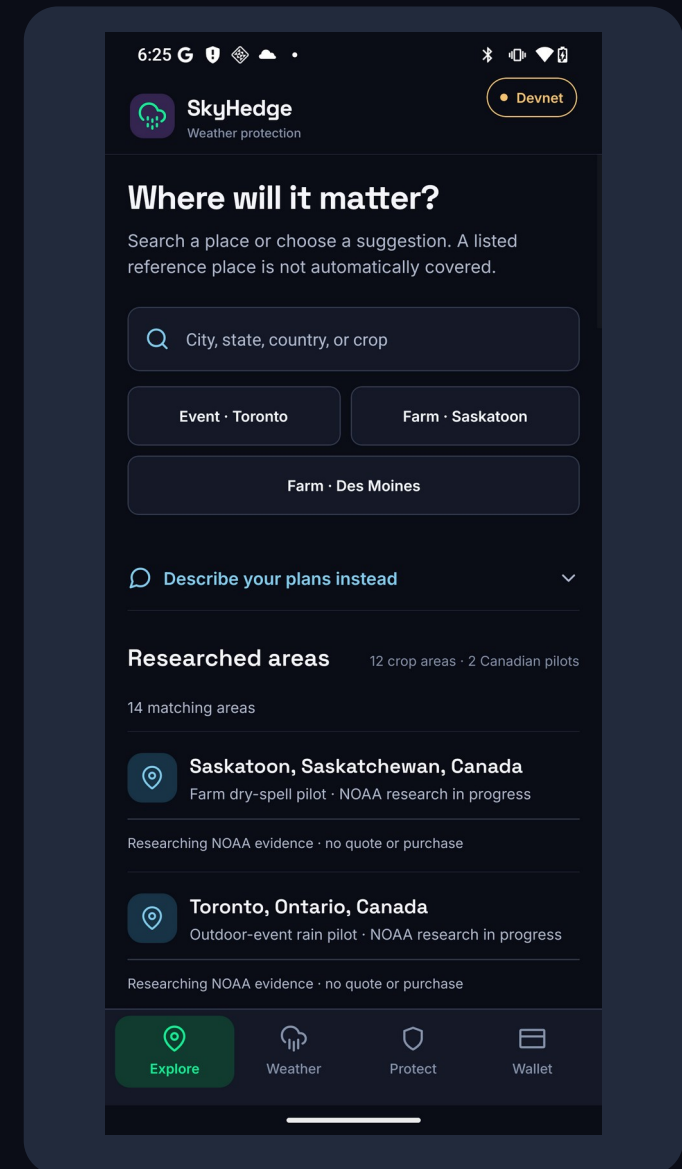

A phone-native decision flow

Choose a place → inspect rainfall evidence → review a SKYT test contract → approve in an MWA-compatible wallet.

Truthful by design

Research-only markets stay blocked. Missing NOAA data is never filled with an estimate.

Captured on the Seeker from the production-API APK.

The oracle attests. The program enforces.

● NOAA

Final station observation
for the pinned window

● SkyHedge signer

Authorized attestation
with source hash

● Solana program

Checks signer and rules;
controls claim transfer

A hash is an audit link, not independent proof that NOAA was truthful. No live payout is claimed before the real observation and final-data period.

One complete journey beats twelve promises.

VERIFIED

Native Android APK
Executable Devnet program + IDL

Finalized chain-status reads

REMAINING PILOT GATES

Cancel expired empty Draft
Create, fund, and open a fresh market
Sign one non-admin mobile test purchase
Verify the finalized position

Today: valueless Devnet SKYT. Later: regulated USD/USDC collateral, more locations, and operational oracle automation.
