SKYHEDGE

Rain on your plans? Get paid.

Weather hedging for individuals and businesses. Pick a trigger, pay a fixed premium, collect a fixed payout.

Best Consumer App on Solana

skyhedge.app · skyhedge.app/app · Solana Devnet

Pre-launch. SKYT is a test token with no value.

PROBLEM

Weather risk reaches everyone.

A lost day can mean a lost income. Most individuals and small businesses carry that risk alone.

Farmers & street vendors

A dry month hurts a harvest. A storm wipes out a day’s sales.

Events & aviation

Rain empties a venue. Bad weather grounds a charter flight.

Traditional weather cover is slow, paperwork-heavy and sized for big buyers.

SOLUTION

A clear trigger. A fixed payout.

- Pick a city, rainfall window and threshold. See “Pay X, get Y if it hits” before buying.
- Station, methodology, window and trigger are fixed on chain before purchase.
- Every city market has its own fully collateralised LP vault. Your full payout is reserved when you buy.
- Solana makes small tickets practical: fast confirmation and low transaction fees.

DEMO · REAL DEVNET BUY

First-time user: Markets → Protect → Phantom

Connect Phantom on Devnet. Get Devnet SOL for fees and SKYT for cover.

1 · Markets → 2 · Protect

Choose an open city market. Pick the window, trigger and cover. Review the premium and maximum loss.

3 · Phantom → confirmed ticket

Approve the buy. Open the finalized Devnet transaction in Explorer. Track the position in Wallet.

Recorded demo example: New York · December rain ≥118 mm · pay 47 SKYT / get 100 SKYT if triggered. Read the live ticket when recording; prices and availability can change.

The recorded buy is real Devnet. Settlement and Collect are shown separately as LOCAL REPLAY.

MONEY FLOW

The payout is already in the vault.

LP collateral + buyer premium → vault

Each city market has a PDA-owned vault. A buy is rejected unless it covers every reserved payout, including the new purchase.

Vault → buyer / protocol / LPs

Trigger hit: buyer collects the fixed payout. At close: 1% of cover goes to the protocol; LPs redeem the remainder pro rata.

Premium = NOAA probability × 1.15, rounded up, plus 1% of cover. The 15% margin stays for LPs. Example: 20% chance, 100 SKYT cover → pay 24; 23 stays for LPs if not triggered, 1 is the protocol fee at close.

No trigger: LPs keep premiums after fees. Data-unavailable: full premium refund, fee waived. Payouts come from LP collateral; SkyHedge earns the fee.

SETTLEMENT · TRUST TODAY

Public data. On-chain rules. One trusted key.

What SkyHedge posts

After the window ends, the worker reads NOAA GHCN-Daily, rejects missing or quality-flagged days, and posts the total plus a SHA-256 hash of the records.

What the program checks

Only the settlement authority may post. Station, methodology and exact window must match. Anyone can then settle: total versus fixed trigger.

No valid reading by window end + 7 days → anyone can mark data-unavailable → buyers reclaim their full premium, including the fee.

Trusted today: SkyHedge’s key copies NOAA faithfully. The hash supports audit; it does not prove the number is correct. A decentralized oracle is next, and is not built yet.

COLLECT · LOCAL REPLAY

Trigger hit → Collect → payout from the vault

LOCAL REPLAY · Same SkyHedge program on a local Solana validator. Separate from the real Devnet buy.

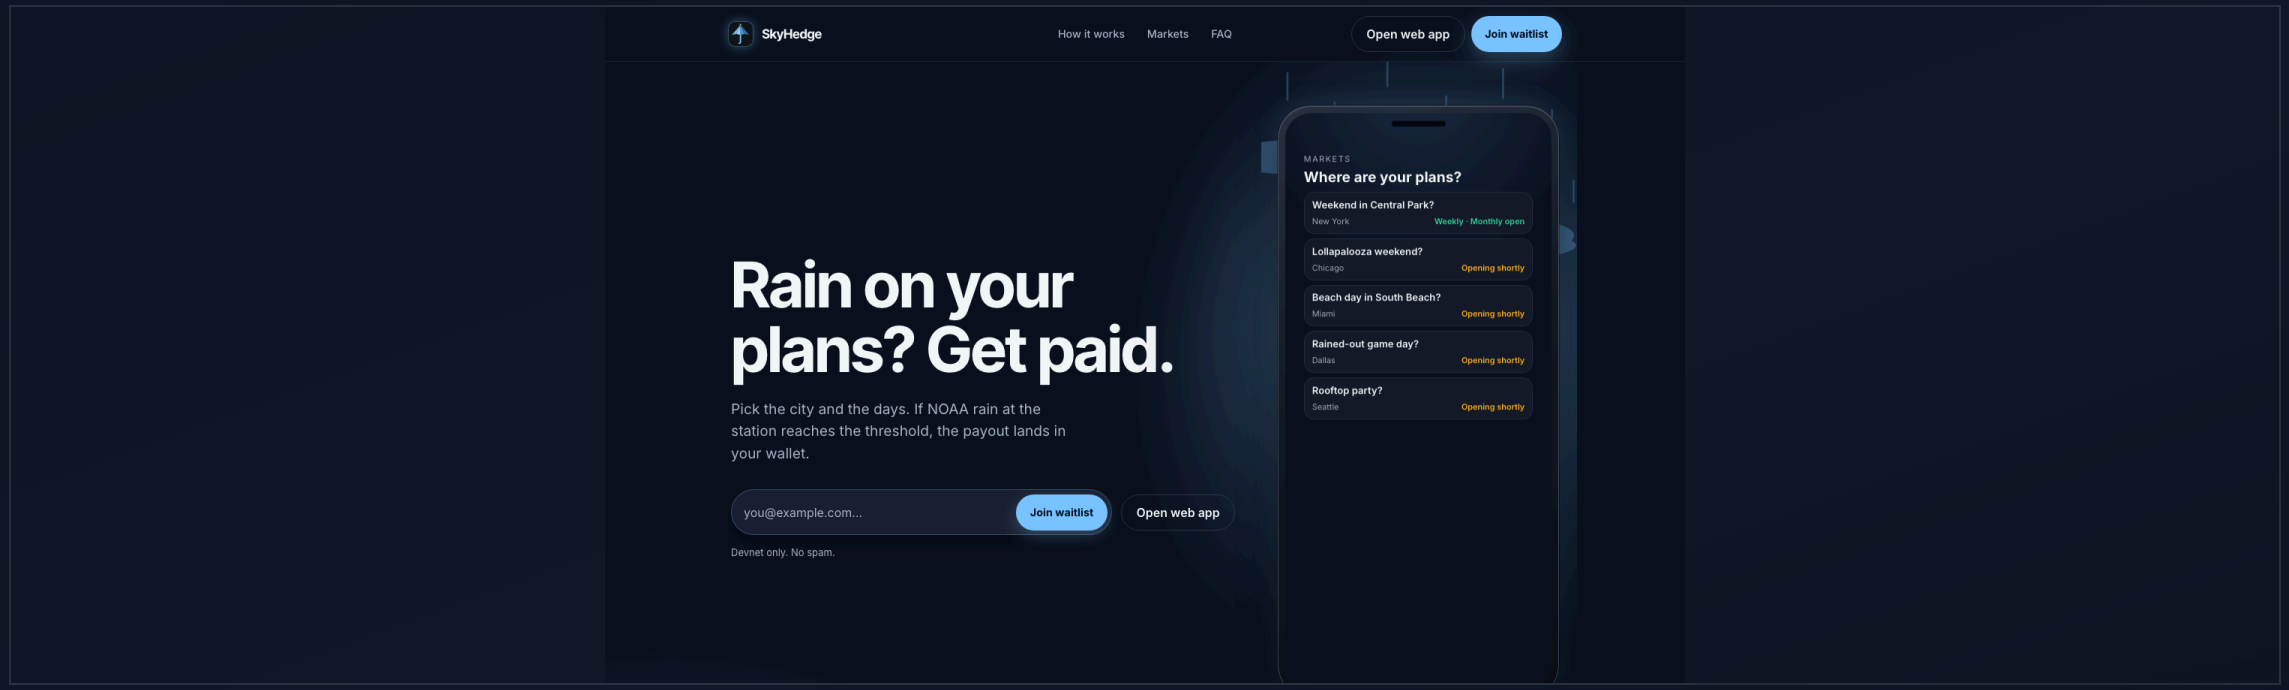

- Observe & settle: real NOAA rainfall in New York, Oct 9–15, 2026. Total: 47.2 mm.
- Collect: the buyer signs the payout claim for the triggered position.
- Receive: 100 local test tokens move from the vault to the buyer.

Replay inputs: 6 mm trigger and 20% demo probability. This is a different market from the December Devnet ticket.

In the app: Wallet → Collect → Phantom approval. Live cover waits for its window to end and NOAA to publish.

PRODUCT · PRE-LAUNCH

Rain on your plans? Get paid.

Live landing: skyhedge.app · Devnet app: skyhedge.app/app

Pre-launch · real Devnet buy demonstrated · no user or volume metrics claimed.

ROADMAP

From Devnet demo to broader access

- Decentralized oracle: replace the SkyHedge settlement key’s data-posting role.
- More cities and perils: extend beyond rain as validated data sources become available.
- LP interface: make vault funding, exposure and redemption easier to understand.
- Broader launch after product validation and legal review.

These are next steps, not completed features.

TEAM
